ACID, Transaction Management and Conccurrency

Control

Introduction

Transactions and Concurrency

Example of a Transaction

Conflicts

Serializability

Locking Tasks

Reasons

- Concurrent execution essential for good DBMS performance.
- Disk accesses frequent, relatively slow. Important to keep the cpu busy by working on several user programs concurrently.
- Client application may carry out many operations on the data retrieved from the database.
- DBMS is only concerned about what data is read/written from/to the database.
- A *transaction* is the DBMS's abstract view of a user program: a sequence of reads and writes.

ACID, Transaction Management and Conccurrency

Introduction

Transactions and Concurrency

Example of a Transaction

Conflicts

Serializability

Locking

Tasks

Transactions and Concurrency

- Users submit transactions, and can think of each transaction as executing by itself.
 - Concurrency is achieved by the DBMS: reads/writes of DB objects of various transactions.
 - transaction must leave the database in a consistent state if the DB is consistent when the transaction begins.
 - DBMS does not need to understand the semantics of the data. (e.g. how the interest on a bank account is computed).
- Issues: Effect of interleaving transactions, and crashes.

- A RDBS ensures this four properties of a transaction:
 - Atomicity: states that database modifications must follow an all or nothing rule.
 - Consistency: states that only valid data will be written to the database.
 - **Isolation**: requires that multiple transactions occurring at the same time not impact each others execution.
 - **Durability**: ensures that any transaction committed to the database will not be lost.

ACID, Transaction Management and Conccurrency Control

Introduction

Transactions and Concurrency

Example of a Transaction

Conflicts

Serializability

Locking Tasks Atomicity of Transactions

- A transaction either commit after completing all its actions or abort after executing some actions.
- A user can think of a transaction as always executing all its actions in one step, or not executing any actions at all.
- DBMS logs all actions so that it can undo the actions of aborted transactions.

Transaction

ACID, Transaction Management and Conccurrency Control

Introduction

Transactions and Concurrency

Example of a Transaction

Conflicts

Serializability

Locking

Tasks

```
BEGIN;

UPDATE ships SET name = 'Alpha'

WHERE name = 'Oleg';

SAVEPOINT my_savepoint;

UPDATE ships SET integrity = 30

WHERE name = 'Alpha';

-- oops ... forget that and update Beta

ROLLBACK TO my_savepoint;

UPDATE ships SET integrity = integrity + 10

WHERE name = 'Beta';

COMMIT;
```

When are those updates valid states for other actions?

Introduction

Transactions and Concurrency

Example of a Transaction

Conflicts

 ${\sf Serializability}$

Locking Tasks

Transactions

- We simplify transaction queries for readability in our next example
- Consider those two transactions:
 - T1: BEGIN ship1.energy = ship1.energy 10, ship2.shields
 = ship2.shields + 10 COMMIT
 - T2: BEGIN ship1.energy = 1.05 * ship1.energy, ship2.shields = 1.05 * ship2.shields COMMIT
- The first transaction is using ship1 energy to recharge ship2 shields.
- Both the energy and the shields are being recharged by a nearby generator which recharge by 5% of the total amount.
- How are those transaction scheduled?

Introduction

Transactions and Concurrency

Example of a Transaction

Conflicts

 ${\sf Serializability}$

Locking Tasks

Non-equivalent transaction results

- Assume s1.energy = 50, s2.shields = 70.
- At the end of the first schedule s1.energy = 52.5 and s2.shields = 84.
- At the end of the second schedule s1.energy = 42 and s2.shields = 83.5
- The two schedules are not equivalent.

ACID, Transaction Management and Conccurrency Control

Introduction

Transactions and Concurrency

Example of a Transaction

Conflicts

Serializability

Locking Tasks

Conflicts of interleaved execution

- The different schedules of transactions might ignore the operations finalized by other transactions.
- Reason: conflicts with Read/Write operations
- Conflicts are caused by the isolation property of transactions.
- The isolation property might cause an anomaly in the database.
- Four possible combination of Read/Write operations: Read/Read, Write/Read, Read/Write, Write/Write

ACID, Transaction Management and Conccurrency Control

Introduction

Transactions and Concurrency

Example of a Transaction

Conflicts

Serializability

Locking

Tasks

Read/Read

- Reading does not alter the state of the database.
- Just reading is always safe!

Example of a Transaction

Conflicts

Serializability

Locking

Tasks

Write/Read

• Dirty read:

T1	T2
A = s1.energy	
s1.energy = A - 10	
	A = s1.energy
	s1.energy = A * 0.5
	B = s2.shields
	s2.shields = B * 0.5
	Commit
B = s2.shields	
s2.shields = B * 0.5	
Commit	

ACID, Transaction Management and Conccurrency Control

Introduction

Transactions and Concurrency

Example of a Transaction

Conflicts

 ${\sf Serializability}$

Locking

Tasks

Write/Read $\overline{\text{(Dirty read)}}$

- Transaction 1 reads and writes the energy. Does not commit
- Meanwhile Transaction 2 reads the energy and the shields, writes them, and then commit.
- Transaction 1 reads and writes the shields and commits.
- **Problem:** Transaction 2 reads the value of the energy before Transaction 1 commits.
- The changes of Transaction 2 are overwritten by Transaction 1.

ACID, Transaction Management and Conccurrency Control

Introduction

Transactions and Concurrency

Example of a Transaction

Conflicts

Serializability

Locking Tasks

$\mathsf{Read}/\mathsf{Write}$

• Unrepeatable reads:

T1	T2
A = s1.energy	
do something else with A	
	A = s1.energy
	s1.energy = A * 0.5
	Commit
A = s1.energy	
s1.energy = A - 10	
Commit	

ACID, Transaction Management and Conccurrency Control

Introduction

Transactions and Concurrency

Example of a Transaction

Conflicts

Serializability

Locking Tasks

Read/Write (Unrepeatable reads)

- Transaction 1 reads the energy and computes the increment, saving it in variable B.
- Transaction 2 reads the energy, writes it and commits.
- Transaction 1 reads the energy again getting a different result.
- Problem: Transaction 2 reads the same value and gets two different results.

Serializability

Transaction
Management
and
Conccurrency

Introduction

Transactions and Concurrency

Example of a Transaction

Conflicts

Serializability

Locking Tasks

Serializability

- We want to get rid of the side effects of the conflicts.
- Serial executions never conflict.
- Transform an interleaved execution into an execution that is equivalent to a serial execution.

Serializability

ACID, Transaction Management and Conccurrency

Control

Introduction

Transactions and Concurrency

Example of a Transaction

Conflicts

Serializability
Locking

Tasks

Conflict serializability

- Two schedules are conflict equivalent if we can transform to one another by swapping non-conflicting operations.
- A schedule is conflict serializable if it is conflict equivalent to a serial schedule.
- The schedule below is conflict equivalent to the serial execution of T1;T2, by making the read/write on B in T1 before the read/write on A in T2.

T1	T2
A = s1.energy	
s1.energy = s1.energy - 10	
	A = s1.energy
	s1.energy = s1.energy * 0.5
B = s2.shields	
s2.shields = s2.shields + 10	
	B = s2.shields
	s2.shields = 0.5 * s2.shields
Commit	
	Commit

Serializability

ACID, Transaction Management and Conccurrency Control

Introduction

Transactions and Concurrency

Example of a Transaction

Conflicts

Serializability

Locking

Tasks

Conflict Serializability

- Conflict serializability is not always achievable.
- The following schedule is not conflict serializable. We cannot swap any of the operations to obtain one of the serial executions T1;T2 or T2;T1 because they conflict.

T1	T2
A = s1.energy	s1.energy = 1000
s1.energy = 2000 Commit	
Commit	Commit

Serializability

Locking

Tasks

Strict Two Phase-Locking (2PL)

- We define two locks on objects, *Shared* and *Exclusive*.
- We denote with X(A) an exclusive lock on an object A.
 We denote with S(A) a shared lock.
- The Strict 2PL scheduler ensures that no anomalies arise from the interleaved executions of the transactions.

ACID,
Transaction
Management
and
Conccurrency
Control

Introduction

Transactions and Concurrency

Example of a Transaction

Conflicts
Serializability

Locking

Tasks

2PL rules

- A transaction that wants to read an object requests a shared lock.
- A transaction that wants to write an object requests an exclusive lock.
- A transaction is allowed to release all the locks only after it commits or aborts (so rollback is executed before another transaction can use the data).

ACID, Transaction Management and Conccurrency Control

Introduction

Transactions and Concurrency

Example of a Transaction

Conflicts

Serializability

Locking Tasks 2PL lock manager

Locks are managed with the following rules

Request	Free	Shared	Exclusive
Shared	Shared	Shared	Denied
Exclusive	Exclusive	Denied	Denied
Unlock	Free	Maybe*	Yes

* It is freed only if all the transactions sharing the read lock can release it.

ACID, Transaction Management and

Unlock(s1)	
Unlock(s2)	V(1)
	X(s1)
	A = s1.energy
	s1.energy = A * 0.5
	X(s2) B = s2.shields
	s2.shields = B * 0.5
	Commit S2.Snields = B · 0.5
	Unlock(s1) Unlock(s2)
	Uniock(S2)

Locking on tables

ACID, Transaction Management and Conccurrency

Introduction

Transactions and Concurrency

Example of a Transaction

Conflicts

 ${\sf Serializability}$

Locking

• Query for T1:

```
SELECT type
FROM ships
WHERE firepower = 1500
```

Query for T2

```
UPDATE ships
SET type = "Star Destroyer"
WHERE firepower >= 1500
```

- Set a shared lock for T1 on the entire table, or
- set a shared lock only on the rows with firepower = 1500 (more concurrency).

Phantom update

Transaction
Management
and
Conccurrency
Control

Introduction

Transactions and Concurrency

Example of a Transaction

Conflicts

 ${\sf Serializability}$

Locking

 Shared lock on rows do not prevent another transaction to add data to a table.

Query for T3

• T1 does not see the row added by T3 (phantom update).

Serializability

Locking

Tasks

Deadlocks

Consider this interleaved schedule

T1	T2
W(A)	(D)
W(B)	W(B)
VV(D)	W(A)
	Commit
Commit	

• A strict 2PL schedule is the following:

T1	T2
X(A)	
W(A)	
	X(B) W(B)
	W(B)
WaitLock(B)	
	WaitLock(A)
Oh noes! A deadlock!	

- Both transaction are stuck waiting for the other lock to be released.
 - This phenomenon is called deadlock.

ACID, Transaction Management and Conccurrency

Control

Introduction

Transactions and Concurrency

Example of a Transaction

Conflicts

Serializability

Locking

Tasks

Deadlock prevention

- Build a graph where each node is mapped to a transaction
- An arrow starts from T1 and points to T2 if T1 is waiting for a lock to be released by T2.
- If we have a cycle in such graph then there is a deadlock.
- The DBMS scheduler aborts transactions involved in a deadlock to free their locks.

Figure: Wait graph with a deadlock.
